

R Package of the Day

Task

You will present on a “cool”, meaningful R package of your choice.

You will propose a package to present on, and once your proposal is approved, you will prepare a 5-7 minute presentation about the R package and main function(s), what it does, and provide a few examples of new R code in action with real data (and not just data from existing vignettes). You will also use cool presentation features in Quarto.

The presentations will be held in class. Please sign up [here](#).

Caveats

You may not present on the following packages:

- *tidyverse* (or any of the packages in the tidyverse),
- any packages that contain just datasets (such as *Lock5Data*, *ISLR2*, *openintro*, etc.) or which accompany books (such as *mdsr*, *moderndive*, *ISLR2*, etc.)

The expectation is to showcase and learn about a package that is used in your own discipline or is connected to your interests.

Submissions

You will

- present in class using Quarto presentation features, and
- submit on Canvas your presentation as an RPub link.

Resources

- [Quarto presentation features](#)

Objectives

- With so many cool new R packages and features coming online daily, it’s hard to keep up! Thus, we will all learn together about some interesting R packages.
- Develop skills in learning about new R packages.
- Develop skills in “data-science” presentations using Quarto features.

Assessment

You will be assessed based on the following aspects of your presentation. Your presentation will be peer-reviewed by other classmates.

- **Content:** Does the presentation clearly explain what the package does, its main functions, and provide examples of new R code in action with real data?
- **Presentation:** Does the presentation effectively use Quarto features to engage the audience and clearly communicate the content?
- **Clarity:** Is the presentation well-organized and easy to follow?
